Date	26 September 2022
Team ID	PNT2022TMID42289
Project Name	VirtualEye - Life Guard for SwimmingPools to Detect Active Drowning
Maximum Marks	2 Marks

Step-1: Team Gathering, Collaboration and Select the Problem Statement

# VIRTUAL EYE 🏖

## Brainstorm & idea prioritization

In this session we aim to achieve a good base for beginning our project. With clear understanding of the task in hand, the next step would be to collectively put in our thoughts/ imagination and end with a proper feasibility

## **Ground Rules**

. Be Creative

problem

- Rule out every possible ideas and improvements
- Make your points clear and purposeful
- Don't hesitate. (Every point is noteworthy)
- Arguments are good ALA it lands beneficial Have various perspectives towards the

## Choose your best "How Might We" Questions

Share the top 5 brainstorm questions that you created and let the group determine where to begin by selecting one question to move forward with based on what seems to be the most promising for idea generation in the areas you are trying to impact.

(†) 10 minutes

## OUESTION 1 How might we detect and differentiate active drowning with the least possible error rate?

QUESTION 2 How might we automate the alert systems so as to provide crutial stats and info to the rescue team ?

OUESTION 3 How might we optimize the detection algorithm to yield results in the least time?

> How might we bring more privacy, yet use camera for detection?

How might we optimally use minimal hardware to get the most accurate information in an around the environment?

Have each participant begin in the "solo brainstorm space" by silently brainstorming ideas and placing them into the template. This "silent-storming" avoids group-think and creates an inclusive environment for introverts and extroverts alike. Set a time limit. Encourage people to go for quantity.

10 minutes

## Aakash.S

Brainstorm solo

High level testing must be carried out before real world deployment.	Proper hyperparameters must be found for the model	Systematic and Efficien algorithms t be followed
Requires HD cameras for good quality frames to be processed	Underwater cameras a possible solution to detect humans under deep water	24/7 Power supply is must for the system to ru & report
Provide critical and proper message to the rescue team	Make sure the stakeholders know, how the system works.	Make sure the stakeholders understand that there is a possibli for a false alarm as well

optimized feed transfer to achieve live realay will less BW to get the classifiable video of underwater footage	able to process absolute drowning and also alrerting the rescue team of passive possibilities as a probable instance	setup an ACS and suggestive ways to ensure the information reaches in one or more ways as this deals with critical life saving situation
ensuring ways where there is a 100% gaurentee of spotting a drowning situations and placing multiple cameras strategically to achive results in unpredictable situations	ensuring the video feed is not being recorded or saved instead being used only for detection which is later discarded	using alternative source of energy such as solar to make a green system but making sure to always have backup supply
having an integration with fitness band companies to get vital stats of a swimmer to have better informational predict possabilities of a	on them signals to ma the drowning	having considered the metrics and variance of different age groups and also ke different swimming environments both
drowning incident	detection easy	controlled and besure

## Rithik.M

The Al should	There should	More cameras
be trained with more samples for better results	be manual alert system in case of detection failure	should be used to improve accuracy.
How will be the accuracy level in the system?	Will the system detect properly if the pool is clumsy?	System should detect multiple drowning and should report the same
For privacy purpose the video stream should not be stored.	The system shouldnt annoy others	cameras can be mounted on the bottom of floating boards for large swimming pools.

## Vijay.R

power backup should be there in case of powercut.	The network connectivity should be good for faster alert trasmission.	cameras should be maintained properly for good results
What happens if animals were encountered in the pool?	Wear.coms genele will be a problem to detect all so multiple camemainate seaded problems.	Use powerful algorithm to get trained from various datasets.
Al should be trained in such a way that it should detect multiple		

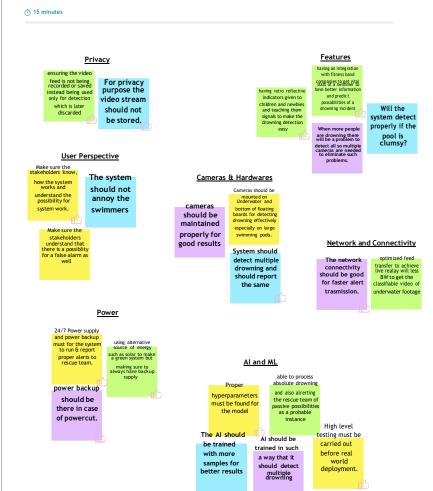

## Swetha.S

optimized feed transfer to achieve live realay will less BW to get the classifiable video of underwater footage	able to process absolute drowning and also alrerting the rescue team of passive possibilities as a probable instance	setup an ACS and suggestive ways to ensure the information reaches in one or more ways as this deals with critical life saving situation
ensuring ways where there is a 100% gaurentee of spotting a drowning situations and placing multiple cameras strategically to achive results in unpredictable situations	ensuring the video feed is not being recorded or saved instead being used only for detection which is later discarded	using alternative source of energy such as solar to make a green system but making sure to always have backup supply
having an integration with fitness band companies to get vital stats of a swimmer to have better informational predict possabilities of a	on them signals to ma the drowning	having considered the metrics and variance of different gage groups and also ke different swimming environments both
drowning incident	detection easy	controlled and liesure

power backup should be there in case of powercut.  What happens if animals were encountered in the pool?	The network connectivity should be good for faster alert trasmission.  Weenowen genele will be a problem to detect all so multiple capemanate seaded problems.	cameras should be maintained properly for good results Use powerful algorithm to get trained from various datasets.
Al should be trained in such a way that it should detect multiple drowning		

## Brainstorm as a group TIP

Have everyone move their ideas into the "group sharing space" within the template and have the team silently read through them. As a team, sort and group them by thematic topics or similarities. Discuss and answer any questions that arise. Encourage "Yes, and..." and build on the ideas of other people along

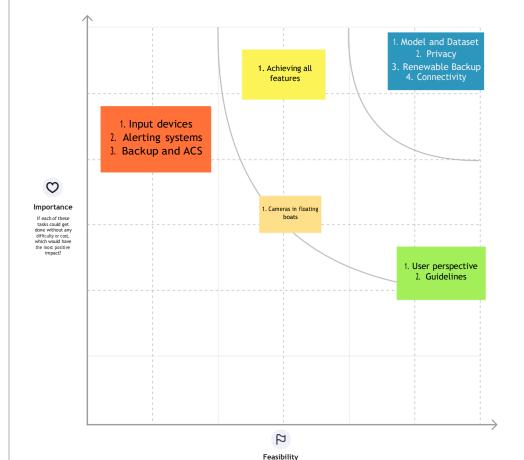

You can use the Voting session tool above to focus

on the strongest ideas.

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

20 minutes

Regardless of their importance, which tasks are more feasible than others? (Cost, time, effort, complexity, etc.)

## Decide your focus

Give each person two icons to vote which idea should your team focus on & assign the duties & responsibilities

## Whats Next...

- 1. Plan and code an effecient model and train it with the correct hyperparameters to produce a probable and accurate result.
- 2. Enhance the system to work in a proper environment in an integrated manner to yield a cohesive solution.
- 3. Create a proper frontend dash to give critial information with atmost clarity and least delay.
- 4. Comeup with the solution that is minimal, portable less intrusive and cost effective.
